The basic structure for using LeanLoader is to provide a path for the asset you wish to load, and then specify optional things in the LLOptions parameter, ex:

```
LeanLoader.load("http://dentedpixel.com/assets/Monkeyshines.png", new
LLOptions().setOnLoad(onImageLoaded).setUseCache(true));
```

Above we specified the cache to be used, and to call the onImageLoad function once the image has been loaded.
